Medicine Self-Assessment**

**Score Interpretation Guide**

This guide will help you interpret the Assessment Score you received on this self-assessment.

The scores on this self-assessment are scaled to have a mean of 20 and a standard deviation of 3 based on a recent group of examinees who took the Medicine Subject Examination for the first time as a final clerkship examination. The following information is provided in response to user requests to “translate” this self-assessment score to the clinical science subject examination equated percent correct scale. The NBME does not warrant that any individual performance on the self-assessment will predict performance on the clinical science subject examination and cautions users of this self-assessment against making any predictive inferences.

In the following table, locate your self-assessment score and find the approximate corresponding subject examination score in the adjacent column. For example, if your self-assessment score is 20, it approximates a Medicine Subject Examination score of 73.

Total test scaled scores from CMS forms started on or after October 29, 2015 cannot be directly compared to scaled scores reported prior to October 29, 2015.

## Incorrect Question Example

2. This is a sample of an incorrect question review. A question having an incorrect answer will appear as it did during the exam, but with a red “X” to the left.

- A) Choice 1
- B) Choice 2
- C) Choice 3
- D) Choice 4
- E) Choice 5

The correct answer is highlighted in yellow. Your answer is indicated by the filled-in circle.
